Fundamentals

UI Components

Usage Guidelines

What we'll talk about

1

AI can transform a design system into a productivity engine

2

Truly meaningful AI applications can be found below the surface

3

**Productivity isn't everything -
don't fall into the productivity trap**

What if we could use AI to supercharge these promises?

To transform VDS from a library into an intelligent partner?

Quality

We build VDS following a rigorous discovery and development process. The expertly designed and coded library fuses together the needs of Verizon with industry standards and best practices.

Consistency

By using VDS, designers and developers can ensure their work aligns with Verizon's brand guidelines. Consistent UI and functionality lends credibility to the brand and builds trust across products and services.

Efficiency

VDS' reusable components and guidelines minimize the amount of repetitive work teams need to take on, enabling them to instead focus more time on addressing customer needs.

Inclusivity

VDS incorporates accessibility best practices at its core, making it easier to ensure that our products and services meet the needs of our diverse customer groups.

We're exploring AI efforts in three key areas

Code Generation

Engineers can leverage Copilot and other tools to instantly add design system components directly into their codebase. This tool guarantees that every component is brand compliant and fully accessible from the start, eliminating guesswork and accelerating development.

Testing & QA

We use AI to automate visual regression and accessibility testing, intelligently identifying bugs or UI inconsistencies that a human might miss. This approach significantly reduces manual QA workload and catches defects earlier, ensuring a more robust user experience.

Process & Workflow

AI acts as a smart assistant within our design tools, providing contextual suggestions and automating repetitive tasks like applying styles. This streamlines the creative process and helps everyone easily adhere to the design system's standards.

Design System Activities Considered for AI Augmentation

Look below the surface

From Tedious to Instant: Generating Code

AI driving efficiency with code generation

Roadmapped 2026

Boilerplate Component Generation

Employing AI for boilerplate component generation, automating the creation of basic component structures. This allows AI to handle repetitive setup and freeing up senior developers for more complex logic.

Figma-to-Code Conversion

Converting Figma-to-code for simple components, creating a tighter link between design assets and live code to accelerate prototyping. Relatedly, generative AI can transform a rough sketch into a functional, interactive prototype or generate HTML and CSS code from a static image.

Cross-Framework Component Translation

Converting VDS components and tokens across web, iOS, Android, and Figma to prevent drift and speed up cross-platform parity.

The Right Help, at the Right Time

AI impacts to process and workflow

User Research Synthesis

AI tools can automatically transcribe user interviews, perform sentiment analysis, and identify key themes and patterns from qualitative data, accelerating the "Discover" phase of the Double Diamond framework.

Brand Compliance Auditing

AI-powered plugins can perform real-time audits of designs against our established design system and brand guidelines. This ensures consistency in color, typography, components, and accessibility standards during the "Deliver" phase reducing manual design review time and handoff errors.

Roadmapped 2026

AI-Assisted Documentation Generation

AI can accelerate the creation of foundational UX artifacts by generating draft user personas from research data, writing user stories, and creating initial drafts of design specifications as well as usage guidelines.

The Core of Our Strategy: Automating Quality

Intelligent automation of visual testing and quality assurance

Basic Accessibility Checks

AI is currently utilized for automated accessibility checks, including linting for ARIA roles and color contrast, aiming to catch common issues early. The goal is to go beyond simple linting to automatically remediate issues and generate accessible code.

Advanced Visual Regression Testing with "Smart Diffing"

Automates the detection of visual regressions and deviations from specs. It involves an automated pipeline that captures screenshots of coded components across all variants, states, and themes, compares them against baseline specs, and flags visual differences for review directly within pull requests.

Roadmapped 2026

VDS Guardian Angel

This Figma companion quietly hovers and surfaces when useful, spotting accessibility issues and nudging designers toward brand alignment. This contributes to proactive quality assurance.

Additional AI Considerations

Productivity with a Purpose: It's Not Just About Speed

AI is transforming our design system from a passive library into a productivity engine.

70%

of Copilot users said they were more productive.

73%

of Copilot users said they could complete tasks faster.

85%

of surveyed workers claimed that AI helps them focus on their most important work.

67%

of Copilot users said it saved them time so they could focus on more important work.

83%

of Copilot for Sales users said it makes them more productive.

**A deliberate focus on quality
is the most direct path to
sustainable productivity gains**

Three Things to Remember

What we talked about

1

AI can transform a design system into a productivity engine

2

Truly meaningful AI applications can be found below the surface

3

**Productivity isn't everything -
don't fall into the productivity trap**

Thank you
