Quick Tips

- Enhanced Use Cases are needed for commercial and open source models.
- You need "Contributor" role access in order to create a new use case.
- Stakeholder not listed?** To become a listed stakeholder, an EnGRAM account is required. New stakeholders can self-register by accessing the [EnGRAM tool](#) while on the Verizon network or VPN. Alternatively, access can be requested on their behalf using the [AYS Engram Access Request](#) form.
- Normally Business Owners create a new use case with details about the use case's purpose and what business problem it solves.
- Technical Leads review the created use cases, and sign off if they agree with the KPIs.
- Adding an optional stakeholder (such as Interested Party) is encouraged to ensure that other project partners or the reviewers have

Use Case Description* ⓘ

VDS adding AI/ML tools to its core offering for Verizon designers and developers

Max. Characters 128

Problem Statement* ⓘ

VDS currently lacks sufficient integrated tooling to enable Verizon designers and developers to efficiently leverage system-wide insights, adopt best practices, and streamline workflows. The existing ecosystem of fragmented tools creates friction, redundancy, and inconsistency across their experiences. Without a unified, consolidated solution, Verizon's digital product teams that use VDS will continue to face significant cognitive overhead, reduced efficiency, and inconsistent adoption of VDS standards.

To address these challenges, we need to invest in and consolidate additional internal tooling, in order to unify disparate capabilities into a cohesive, single experience. Doing so will enhance adoption of VDS, reduce operational complexity, and empower downstream teams to rapidly deliver consistent, high-quality digital products at scale.

Business Value* ⓘ

Currently, designers and developers at Verizon lose valuable time navigating fragmented tools and inconsistent workflows. The consolidation of VDS tooling into Signal addresses these pain points directly, creating operational efficiencies and enabling teams to focus on value-generating work rather than process overhead.

By developing a unified set of VDS tools, VDS will drive measurable improvements across key business metrics:

- Speed-to-Market: Teams can rapidly produce consistent, high-quality experiences, accelerating the delivery timeline.
- Increased Adoption & Compliance: Streamlined tools encourage broader and more consistent adoption, enhancing product quality and compliance with brand and accessibility standards.
- Reduced cognitive load for designers and developers, which promotes increased creativity, productivity, and employee satisfaction.
- Enhanced scalability and sustainability of the design system, reducing long-term maintenance and management costs.

Ultimately, this new toolset for VZ designers and developers will make VDS not merely a reference library but as a critical enabler of Verizon's broader digital product efforts.
