

Partnership to Platform

How VDS is engineering an intelligent and accessible future

What is VDS?

our “people partnership”

Fundamentals

Components

Documentation

The Value of VDS

Consistency

By using VDS, designers and developers can ensure their work aligns with Verizon's brand guidelines. Consistent UI and functionality lends credibility to the brand and builds trust across products and services.

Scalability

The VDS centralized library of reusable components, patterns and guidelines can be used across numerous journeys and touchpoints.

Quality

We build VDS following a rigorous discovery and development process. The expertly designed and coded library fuses together the needs of Verizon with industry standards and best practices.

Accessibility

VDS incorporates accessibility best practices at its core, making it easier to ensure that our products and services meet the needs of our diverse customer groups.

Efficiency

VDS reusable components and guidelines minimize the amount of repetitive work teams need to take on, enabling them to instead focus more time on addressing customer needs.

Speed-to-Market

The VDS library is versatile, allowing teams to rapidly innovate and experiment. This enables us to ship experiences sooner, meaning we're able to gain insights and iterate more quickly to meet customer needs.

Accessibility

VDS incorporates accessibility best practices at its core, making it easier to ensure that our products and services meet the needs of our diverse customer groups.

A New Status Quo

and the challenge of scale

However, this has created a new problem

However, this has created a new problem
people don't scale too well

An Intelligent Platform

AI Integration Opportunities

AI Integration Opportunities

AI driven **context** aggregation

Can we take our entire Verizon Design System, all of our **guidelines**, our **documentation**, our **spec files**, and our **proprietary code**, and use it to teach an AI to be our perfect, on-brand, intelligent partner?

And then, can we take that same partner, already an expert on our design system, and layer in the context of our audience?

All of our **user research**, our **analytics data**, and our **accessibility guidelines** fully transforming it into a truly empathetic, inclusive, and data-driven partner?

AI driven testing

example 1

Test ID: hash of the test id here

VDS Button

Label	Log In
kind	Secondary
size	Large
State	Default
width	Auto

Figma Component

Test App Screenshot

Overlay

TEST RESULT: fail

REASONING:
Button background color mismatch: Figma shows white fill (#FFFFFF) vs implemented pink/coral background. Border implementation differs: Figma has white stroke border, implementation shows no visible border or different border treatment. Background surface color differs significantly: pure red (#F0014) in Figma vs coral/pink gradient in implementation.

SCORES:
SSIM 75.73% and MSE 33.45% fall below 96% threshold; histogram diff 0.564% is good but Vector Distance 15.924% indicates significant color deviation

❌ Component failed the test

example 2

Test ID: hash of the test id here

VDS Button

Label	Log In
kind	Secondary
size	Large
State	Default
width	Auto

Figma Component

Test App Screenshot

Overlay

TEST RESULT: fail

REASONING:
Background fill color mismatch: Figma shows white (#FFFFFF) fill, implementation shows red/transparent fill. Border implementation differs: Figma has white stroke border visible, implementation appears to have white border on red background creating different visual effect. Font rendering shows white text on red vs black text on white, indicating incorrect button kind/style implementation.

SCORES:
Algorithmic scores below threshold (SSIM 43.8%, MSE 36.2% match, Vector Distance 15.4%) with critical visual differences in background color and border treatment

❌ Component failed the test

example 3

Test ID: hash of the test id here

VDS Button

Label	Log In
kind	Primary
size	Large
State	Default
width	Auto

Figma Component

Test App Screenshot

Overlay

TEST RESULT: pass

REASONING:
1. Algorithmic scores exceed 96% threshold (SSIM: 96.77%, Histogram: 99.99%)
2. Button properties match specifications: white background (#FFFFFF), max border radius (9999px), correct padding (24px horizontal, 12px vertical)
3. Text styling is identical: 'Log In' label, bold font weight, black color (#000000), large font size with proper letter spacing (0.5)

SCORES:
SSIM 96.77%, Histogram 99.99%, MSE 7.41% - All core metrics exceed threshold with negligible visual differences

✅ Component passed the test

Variant testing can get a little crazy

The Next Steps

a three pillar framework

Where we go from here

1

Empower

giving teams the tools they need

2

Train

teaching the necessary skills

3

Aggregate

centralizing and structuring our context so AI gives
Verizon specific guidance at the right time

The Next Decade

people & technology
